In this assignment we have created a program to scrape twitter using an API. Its a simple process with which the user simply writes what topic they would liked scraped. It could be a hashtag or a simple topic i.e. tesla model x or #tesla. The program would then scrape the site which would then retrieve all the relevant data.
This process could have further queries if need be. For instance if you would like tweets to be scraped from a certain location, our program would convert the location name to its specific geo coordinates. For instance new york or even an exact location.

The output would be in the form of a list of tweets with the exact query written.
